Aesthetic Dentistry

The goal in aesthetic dentistry is to individually design natural looking artificial teeth that are compatible with the person's face. Aesthetic dentistry is a combination of science, technology and art. Aesthetic dentistry applications include smile design, All-ceramic restorations, Laminate veneer, Aesthetic composite fillings.

Zirconia Crowns

Porcelains with zirconium infrastructure are biocompatible prostheses that are safely preferred in teeth and surrounding tissues, as they are both aesthetic enough to be used in anterior teeth and strong enough to be used in posterior teeth.

Orthodontics

Correction of dental crowding and jaw anomalies is provided in children and adults. It covers the treatments of stenosis of the jaw, crowding, cases where the lower jaw is forward or behind, and cases where there are deviations. Orthodontic treatment is performed with traditional bracketing methods and clear plates. (Invisalign)

Endodontics

Root canal treatment is the process of cleaning and sealing the inflamed tissues in the tooth root, which causes pain, abscess and cyst formation in the teeth.

Radiography

Radiography systems used in our clinic are panoramic x-ray, cephalometric x-ray, dental volumetric tomography, digital periapical radiographies.

Pedodontics

Pediatric dentistry includes oral examination, tooth extraction, filling, root canal treatment, fluoride application and fissure sealant treatments.

Implantology

The implant, which is applied by placing titanium screws into the jawbone, is an artificial tooth root. Thanks to the implants, the patient's healthy teeth are preserved, since tooth cutting is not performed as in traditional crown and bridge prostheses. In addition, implant-supported removable and fixed prostheses can be made by using implants for the retention of dentures in edentulous patients.

Periodontology

It covers the treatments and surgeries of gingival bleeding, tartar accumulation, bad breath, gingival recession or enlargement, alveolar bone loss surrounding the tooth.

Conservative Dentistry

It is the cleaning of dental caries and filling the formed cavity with a suitable filling material. Today, it is possible to make highly aesthetic and durable fillings with developing composites.

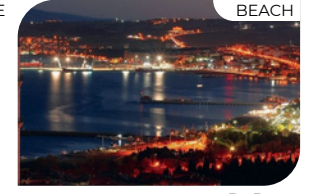

Bleaching

Bleaching is the process of removing the discoloration that occurs in the structure of the teeth (enamel and dentin layer). As a result of this application, the color of the teeth can be lightened several tones.

Prosthesis

It is a form of treatment in which fixed or removable prostheses are applied, by evaluating details such as the number of teeth remaining in the mouth, the locations of these teeth in the mouth, and the durability of the teeth of patients with missing teeth.
